

Perfluoroalkyl and Polyfluoroalkyl substances (PFAS) are manufactured chemicals found in Teflon and nonstick cookware,

pizza boxes and other grease-resistant food containers, water-resistant clothing, stain-resistant coatings, and firefighting foam.

Polychlorinated biphenyls (PCBs) are manmade chemicals used in electrical equipment, including transformers.

Flame retardants. Many flame retardants, including PBDE, are endocrine disruptors.

Diethylstilbestrol (DES) is a synthetic form of the female hormone estrogen that was given to pregnant women up to the 1970s to prevent miscarriages. It is now banned.

Bisphenol A (BPA) is a manmade chemical used to harden plastics. It is also used in the lining of cans that are used for soups, sodas, canned fruits, and vegetables. BPA has been linked to breast cancer, diabetes, healthy brain function and obesity.

Dichlorodiphenyltrichloroethane (DDT) is an insecticide pesticide widely used before 1972. It is now banned in the U.S.

Phthalates are used to make plastics soft. They are also used to enhance fragrances and make the fragrances last longer.

Why reductions to EDs are important

Because endocrine disruptors are chemicals that are able to affect how your hormone system works and interfere with its natural regulation, it is very important to reduce your exposures to these chemicals wherever possible.

One critical time of exposure is during pregnancy because it has been proven that endocrine-disrupting chemicals cross the placenta and thus expose the unborn baby to these chemicals.

While it is true that endocrine-disrupting chemicals are now ubiquitous in our environment, understanding where they can be found makes it easier to avoid many of them and reduce exposures.

EHHI BOARD MEMBERS

Susan S. Addiss, MPH, MURs. Past Commissioner of Health for the State of Connecticut; Past President of the American Public Health Association; Past member of the Pew Environmental Health Commission.

Nancy O. Alderman, MES. President of Environment and Human Health, Inc.; Past member of the National Board of Environmental Defense Fund; Recipient of the Connecticut Bar Association, Environmental Law Section's, Clyde Fisher Award; and the New England Public Health Association's Robert C. Huestis/Eric Mood Award for outstanding contributions to public health in the environmental health area.

Gaboury Benoit, PhD. Grinstein Professor of Environmental Chemistry at Yale University's School of the Environment; Director of the Hixon Center for Urban Ecology. Co-author of *The Land and Natural Development (L.A.N.D.) Code* and *New Strategies for America's Watersheds*.

D. Barry Boyd, MD. Yale University School of Medicine, Oncologist at Smilow Cancer Center-Greenwich. Research areas include environmental risk factors for cancer as well as cancer etiology, including nutrition and the role of insulin and IGF in malignancy. Founder and Director of Integrative Medicine at Greenwich Hospital – Yale Health System.

David R. Brown, Sc.D. Public Health Toxicologist and Director of Public Health Toxicology for Environment and Human Health, Inc.; Past Chief of Environmental Epidemiology and Occupational Health at Connecticut's Department of Health; Past Deputy Director of The Public Health Practice Group of ATSDR at the Centers for Disease Control and Prevention (CDC).

Thomas F. Harrison, Esq. Connecticut Environmental Lawyer; Past Assistant Attorney General in the New York State's Attorney General's office; Past Regional Counsel in the largest U.S. EPA Office, Region 5; Past Senior Corporate Council to the B.F. Goodrich Company; Past Partner at the Hartford law firm of Day Pitney LLP; Past Chairman of the Environmental Section of the Connecticut Bar Association.

Pinar H. Kodaman, MD, PhD. Assistant Professor of Obstetrics, Gynecology, and Reproductive Sciences, Division of Reproductive Endocrinology and Infertility, Yale University School of Medicine; Director of the Early Recurrent Pregnancy Loss Program at the Yale Fertility Center.

Barbara S. Miller, Esq. Senior Counsel and past partner at the Southport, CT law firm of Brody Wilkinson PC; Past member of the Executive Committee of the Environmental Law Section of the Connecticut Bar Association; Member, Board of Directors of the Connecticut Zoological Society, Inc.; Past Vice-President of the Connecticut Fund for the Environment, Inc.; Past Chair of the Connecticut Audubon Society Coastal Center Board of Directors.

Sarah S. Mougalian, MD. Assistant Professor of Medical Oncology with a focus on Breast Medical Oncology, Smilow Cancer Center, Yale University School of Medicine. Recipient of many awards, including the Clifton Howe Award given for clinical excellence to a medical oncology fellow.

Hugh S. Taylor, M.D. Anita O'Keeffe Young Professor and Chair of the Dept. of Obstetrics, Gynecology, and Reproductive Sciences and Dept. of Molecular, Cellular, and Developmental Biology, Yale School of Medicine; Chief of Obstetrics and Gynecology at Yale-New Haven Hospital.

John P. Wargo, Ph.D. Tweedy-Ordway Professor of Environmental Health and Political Science at Yale University's School of the Environment. Author of two award-winning books, *Green Intelligence* and *Our Children's Toxic Legacy*.

The Community Foundation for Greater New Haven.*

ENDOCRINE DISRUPTORS

REDUCE EXPOSURES, ESPECIALLY DURING PREGNANCY

ENVIRONMENT & HUMAN HEALTH, INC.

1191 Ridge Road

North Haven, Connecticut 06473

What are endocrine disruptors?

Endocrine disruptors (EDs) are chemicals that interfere with the normal function of the endocrine system, which is a network of

glands and organs that secrete hormones. The endocrine system works with other bodily functions to regulate the human body. Endocrine-disrupting chemicals (EDCs) interfere with the normal functions

of the body. Endocrine disruptors are commonly found in food, personal care products, pesticides, plastics and many other commercial products.

What do exposures to EDs affect?

Breast Cancer

Breast cancer is the second most common cancer and the fifth

deadliest in the world. Exposure to endocrine-disrupting pollutants has been suggested to contribute to the increase in incidence.

Attention-Deficit/Hyperactivity Disorder (ADHD)

Currently, ADHD is the most common childhood neurobehavioral disorder, impacting approximately 9.4% of children in the U.S.

Scientists believe that prenatal and early childhood exposure to endocrine-disrupting chemicals can affect ADHD.

Early Puberty

The presence of endocrine-disrupting chemicals is suspected to contribute to the earlier onset of puberty. The persistent and long-term use of EDCs has harmful effects on human reproductive health by interfering with the synthesis and mechanism of action of sex hormones.

Low Sperm Count

Falling sperm counts have been linked to endocrine disruptors.

Obesity

Recent findings demonstrate that endocrine-disrupting chemicals can cause weight gain. Animal models and epidemiological

studies have shown that an especially sensitive time for exposure to these chemicals is *in utero* or during the neonatal period.

Diabetes

Epidemiological studies indicate that the increased presence of

endocrine-disrupting chemicals (EDCs) in the environment may play an important role in the incidence of metabolic diseases.

Endometriosis

Exposure to endocrine disruptors has been suggested to be one factor in the increasing incidence of endometriosis.

Where are endocrine disruptors found?

Endocrine disruptors include chemical compounds that people are exposed to in their daily lives, including industrial, household, and personal care products. Some endocrine-disrupting chemicals are found in dryer sheets, fragrances, pesticides, and plastics.

Dryer sheets often contain fragrances and endocrine-disrupting chemicals. A study in *Environmental Health Perspectives* showed that five dryer sheets emitted 15 endocrine-disrupting

compounds (EDCs). Evidence from studies suggests that EDCs can affect developing reproductive and nervous systems, metabolism, and cancer.

Fragrances and scented candles commonly contain phthalates to help the scent last longer. Under current law, phthalates in

fragrances can simply be labeled "fragrance," even though they may make up 20% or more of the product. Since laws protect

perfume manufacturers from sharing "trade secrets," most perfumes sold commercially contain chemicals not listed individually on the ingredient label.

Pesticides

Pesticides include insecticides, for killing insects; herbicides, for killing weeds; fungicides for killing mold, mildew, and fungi (mushrooms); and rodenticides for killing mice and rats. Almost

all pesticides are endocrine disruptors. Roundup, and all glyphosate products, are examples of pesticide endocrine disruptors. Inert ingredients are added to pesticides to make the pesticide work better. Most of the inert ingredients have also been proven to be endocrine disruptors.

Firefighting foam

Firefighting foams contain PFAS. They serve as surfactants that spread the foam to cool and suppress the fire. While they are

extremely effective, they are also a major source of PFAS pollution around the world. An analysis of U.S. Environmental Protection Agency (EPA) monitoring data reported high levels of PFAS in groundwater and surface water at military

bases and airports where the foam was used in training exercises. The country is working on finding replacement foams, but the ones currently available still have trace quantities of PFAS.
